Zaragoza

Epidemiologia SCA

MORTALIDAD POR ENFERMEDAD CORONARIA EN ESPAÑA

- En España, las tasas de mortalidad por EC han disminuido de manera continuada durante los últimos 40 años (fig. 1A).
- Sin embargo, el numero absoluto de muertes por EC aumentó de 1980 a 2000 y se ha reducido de manera constante desde entonces (fig. 1B).
- La EC sigue siendo la más frecuente causa individual de muerte para los varones y la segunda para las mujeres.

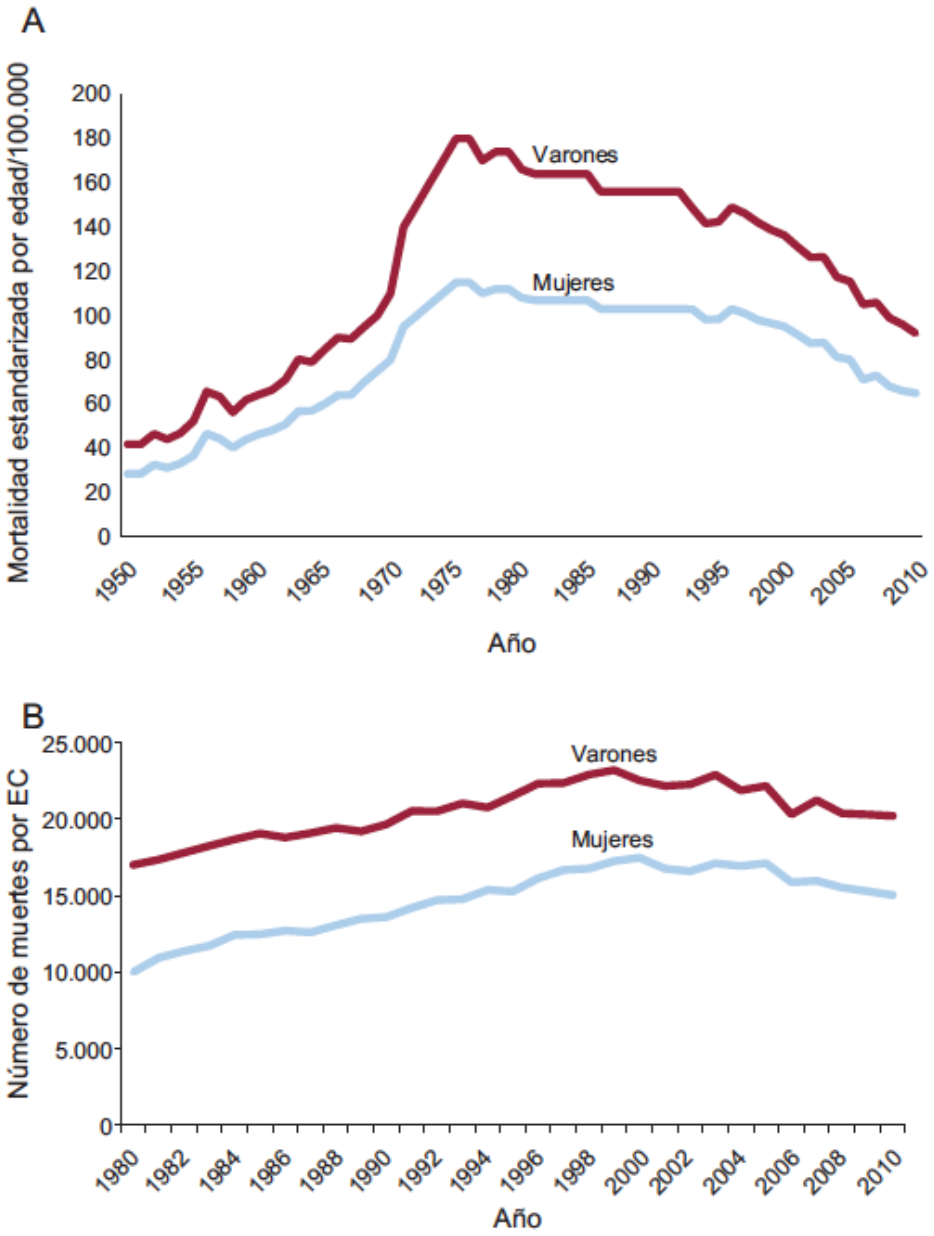

Figura 1. Tendencia de la mortalidad por enfermedad coronaria en España. A: tasas estandarizadas de mortalidad por enfermedad coronaria en 1950-2010 según el sexo. B: número de muertes anuales por enfermedad coronaria en 1980-2010 según el sexo. EC: enfermedad coronaria.

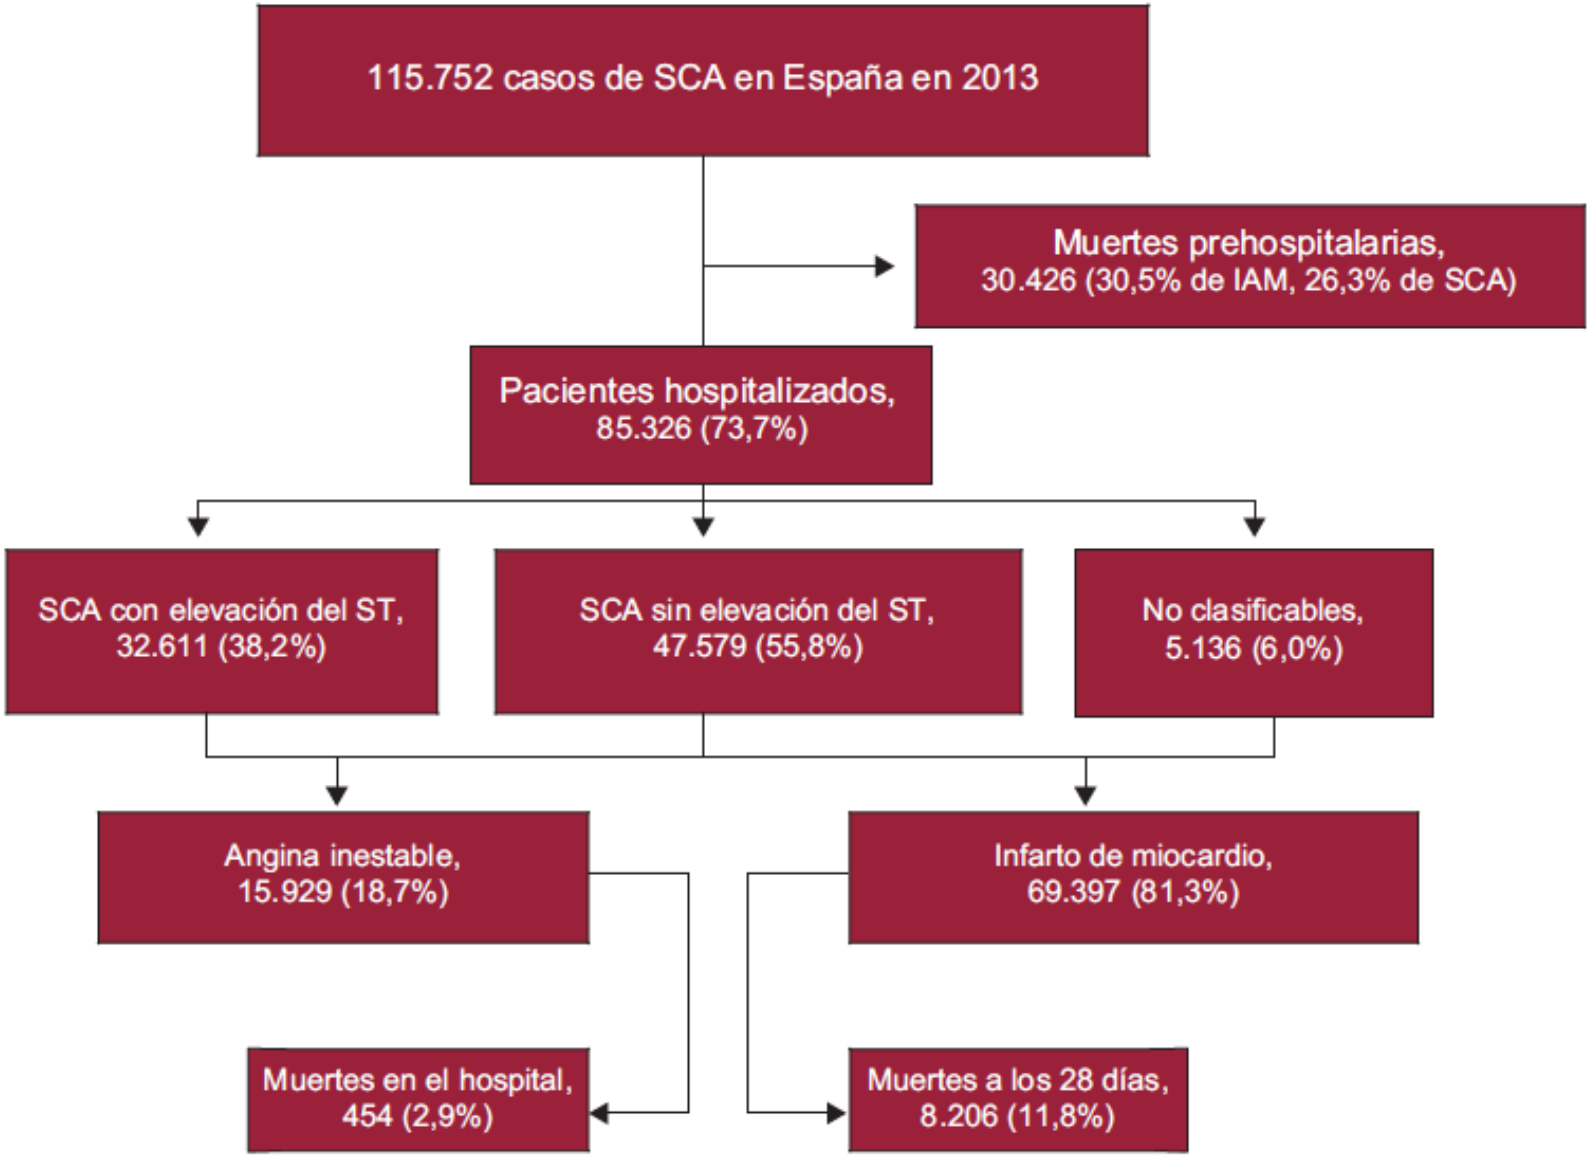
Figura 6. Estimación del número de síndromes coronarios agudos esperables desde 2005 a 2049 según sexo y grupo etario en la población española. Reproducido con permiso de Dégano et al[15]. SCA: síndrome coronario agudo.

I. Ferreira-Gonzalez / Rev Esp Cardiol. 2014;67(2):139–144 141

Número de casos de sindrome coronario agudo en España 2013



I.R. Degano et al / Rev Esp Cardiol. 2013;66(6):472–481

Letalidad 2013

- En 2013, la letalidad del SCA a los 28 días será del 34% en total, de un 10% en los pacientes que lleguen con vida al hospital y de un 26% en las muertes fuera del hospital.
- Estas cifras representan una ligera mejora, en especial en cuanto a los pacientes hospitalizados, respecto a las estimaciones de 2002, que fueron del 38, el 15 y el 27% respectivamente.

SCACST vs SCASST

- En los últimos años, la proporción de pacientes con SCA con elevación del segmento ST (SCACEST) ha disminuido, mientras que la proporción de pacientes con SCASEST ha aumentado.
- Los pacientes con SCASEST tienden a ser de mayor edad y a tener una EC mas extensa. Así pues, teniendo en cuenta el envejecimiento esperado de la población, se prevé un aumento del porcentaje de pacientes con SCASEST en las próximas décadas.

Perfil del SCA en España

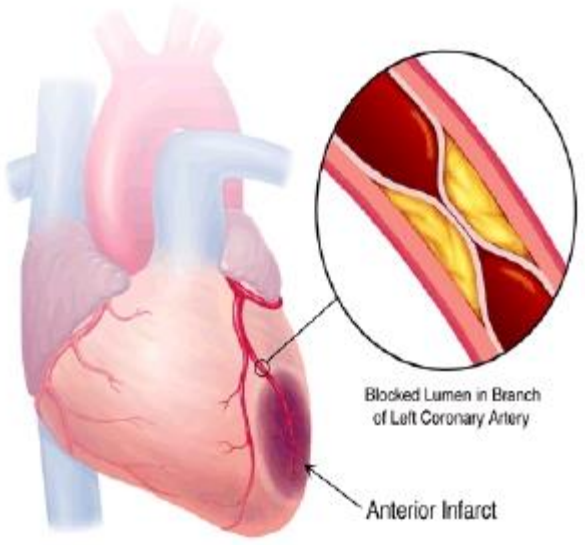
CLASIFICACION SINDROME CORONARIO

Myocardial Infarction Type 1

Spontaneous myocardial infarction related to **atherosclerotic plaque** rupture, fissuring, or dissection with resulting intraluminal thrombus in one or more coronary arteries leading to decreased myocardial blood flow with ensuing myocyte necrosis

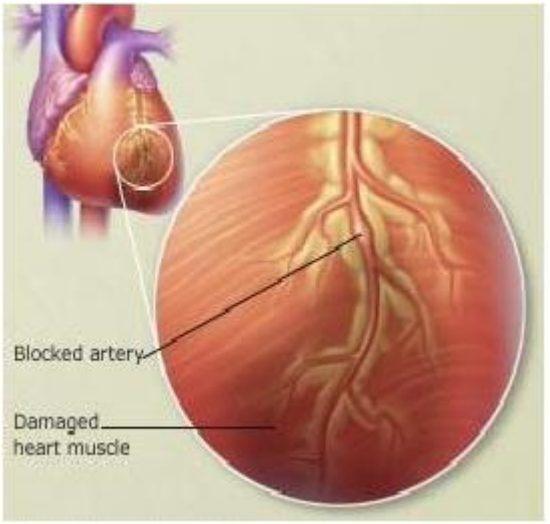


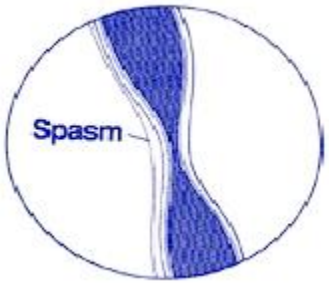
Update

Third Universal Definition of Myocardial Infarction

Myocardial Infarction Type 2

Myocardial infarction where a condition other than CAD contributes to an imbalance between myocardial oxygen supply and/or demand, e.g. coronary artery spasm, tachy-/brady-arrhythmia, anaemia, respiratory failure, hypotension or hypertension





Update

Third Universal Definition of Myocardial Infarction

ST Segment Elevation Criteria

New ST elevation at the J point in 2 contiguous leads with the following cut-points:

- **≥0.1 mV in all leads except leads V_2–V_3 in men and women**
- **In leads V_2-V_3, ≥0.2 mV in men ≥40 years and ≥0.25 mV in men <40 years**
- **In leads V_2-V_3, ≥0.15 mV in women**

Age and gender specific

Update

Third Universal Definition of Myocardial Infarction

Non-ST Segment Elevation Criteria

- New horizontal or down-sloping ST segment depression ≥0.05 mV in 2 contiguous leads

OR

- T inversion ≥0.1 mV in 2 contiguous leads with prominent R wave or R/S ratio >1

Unchanged

Third Universal Definition of Myocardial Infarction

ESC SCASEST 2011: Estratificación del riesgo

Recomendaciones para el diagnóstico y la estratificación del riesgo

Recomendaciones	Clase[a]	Nivel[b]	Ref[c]
En pacientes con sospecha de SCASEST, el diagnóstico y la estratificación del riesgo isquémico/hemorrágico a corto plazo se debe basar en la combinación de la historia clínica, síntomas, hallazgos físicos, ECG (monitorización del segmento ST continua o repetida) y biomarcadores	I	A	16, 18, 27, 30, 56-58
Se recomienda el uso de clasificaciones de riesgo establecidas para el pronóstico y el sangrado (p. ej., GRACE, CRUSADE)	I	B	50, 83
y antes del alta hospitalaria			
Se recomiendan otras derivaciones para el ECG (V_{3R}, V_{4R}, V_7-V_9) cuando las derivaciones habituales no son concluyentes	I	C	18
Se debe tomar una muestra de sangre rápidamente para la determinación de troponinas (troponina cardiaca T o I). Los resultados deben estar disponibles en un plazo de 60 min. La prueba debe repetirse a las 6-9 h de la evaluación inicial si la primera determinación no es concluyente. Es aconsejable repetir la determinación después de 12-24 h si el estado clínico sigue indicando SCA	I	A	27, 30
Se recomienda un protocolo rápido de exclusión (0 y 3 h) cuando se disponga de pruebas de alta sensibilidad para determinación de troponinas	I	B	20, 21, 23
Se recomienda un ecocardiograma a todos los pacientes para evaluar la función ventricular izquierda general y regional y para descartar o confirmar un diagnóstico diferencial	I	C	–
La angiografía coronaria está indicada en pacientes en los que se tenga que determinar la extensión de la enfermedad coronaria o de la lesión causal (véase la sección 5.4)	I	C	–
La angiografía coronaria por TC se debe considerar como una alternativa a la angiografía invasiva para excluir un SCA cuando hay una probabilidad baja a intermedia de enfermedad coronaria y cuando las troponinas y el ECG no sean concluyentes	IIa	B	37-41
En pacientes sin dolor recurrente, con ECG normal, troponinas negativas y clasificación de riesgo baja, se recomienda una prueba de estrés no invasiva para inducción de isquemia antes de decidir sobre la estrategia invasiva	I	A	35, 54, 55

CRUSADE: Can Rapid risk stratification of Unstable angina patients Suppress ADverse outcomes with Early implementation of the ACC/AHA guidelines; ECG: electrocardiograma; GRACE: Global Registry of Acute Coronary Events; SCA: síndrome coronario agudo; SCASEST: síndrome coronario agudo sin elevación del segmento ST; TC: tomografía computarizada.

GRACE 2.0 Risk Calculator

The GRACE 2.0 ACS Risk Calculator implements the revised GRACE algorithms for predicting death or death/myocardial infarction following an initial acute coronary syndrome (ACS).

WHAT'S NEW IN 2.0?

- "Mini-GRACE" algorithm (for use when serum creatinine and Killip class may not be available)
- New 1- and 3-year calculations
- New calculations provide probabilities directly, bypassing scores
- Population histograms with high-, medium- and low-risk markers

ANTIAGREGACION

- La identificación del síndrome coronario agudo (SCA) como un proceso aterotrombótico ha dado un papel predominante a las plaquetas en la enfermedad cardiovascular.
- La eficacia de la antiagregación plaquetaria en la prevención y el tratamiento de las enfermedades cardiovasculares es un hecho establecido y comprobado en numerosos estudios

Tabla 1.
CLASIFICACIÓN DE LOS MEDICAMENTOS ANTIPLAQUETARIOS.

Sitio de acción	Fármaco	Ruta de administración
Inhibidor de la ciclo-oxigenasa 1 (COX-1)	Ácido acetil salicílico	Oral / IV / Rectal
Tienopiridinas	Ticlopidina	Oral
	Clopidogrel	Oral
	Prasugrel	Oral
Inhibidores del receptor $P2Y_{12}$ no tienopiridinas	Ticagrelor	Oral
	Cangrelor	IV
	Elinogrel	Oral / IV
Inhibidores Gp IIb/IIIa	Abciximab	IV
	Tirofibán	IV
	Eptifibatide	IV
Inhibidores de la fosfodiesterasa	Dipiridamol	Oral
	Cilostazol	Oral
Inhibidores PAR_1	Varopaxar	Oral
	Atopaxar	Oral

Gp: glicoproteína. IV: intravenoso.

¿Por que buscar nuevos antiagregantes?

- La eficacia del clopidogrel se ve limitada por la lenta y variable transformación del profármaco en metabolito activo
- Una modesta y variable inhibición plaquetaria,
- La irreversibilidad de acción
- El incremento del riesgo de sangrado y el mayor riesgo de trombosis del stent e infarto agudo de miocardio (IAM)
- Un riesgo trombótico residual en los pacientes con respuesta pobre.

TABLA 1. **Nuevas dianas terapéuticas plaquetarias y fármacos antiagregantes en distintas fases de desarrollo en SCA. Estudios en fase 3**

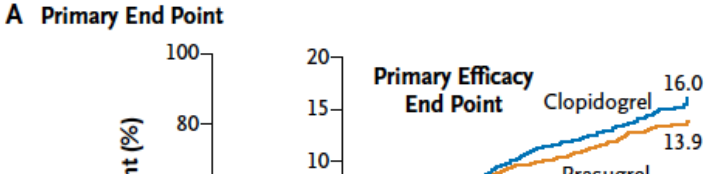
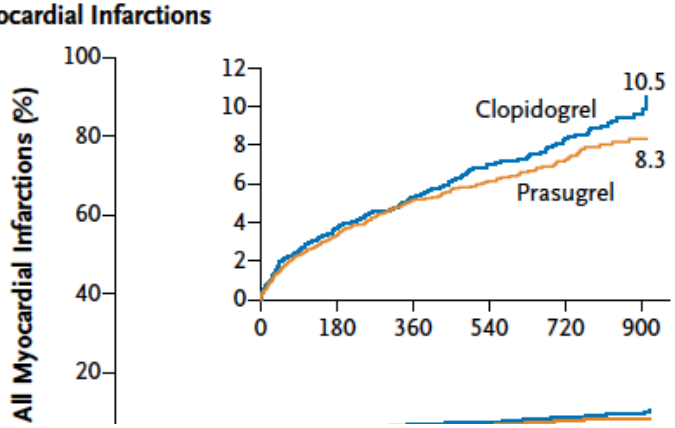
CONCLUSIONS

In patients with acute coronary syndromes with scheduled percutaneous coronary intervention, prasugrel therapy was associated with significantly reduced rates of ischemic events, including stent thrombosis, but with an increased risk of major bleeding, including fatal bleeding. Overall mortality did not differ significantly between treatment groups. (ClinicalTrials.gov number, NCT00097591.)

Prasugrel versus Clopidogrel for Acute Coronary Syndromes without Revascularization

TRILOGY ACS





CONCLUSIONS

Among patients with unstable angina or myocardial infarction without ST-segment elevation, prasugrel did not significantly reduce the frequency of the primary end point, as compared with clopidogrel, and similar risks of bleeding were observed. (Funded by

Disnea

- **Mas frecuente en el brazo de ticagrelor:**

  13,8% versus 7,8% (IC95%: 1,68-2,02; p<0,001)

- **Baja interrupción del tratamiento por disnea:**

  0,9% versus 0,1% (IC95%: 3,41-11,01 ; p< 0,001)

- **Aproximadamente sólo 1/100 discontinuaron el tratamiento por disnea.**

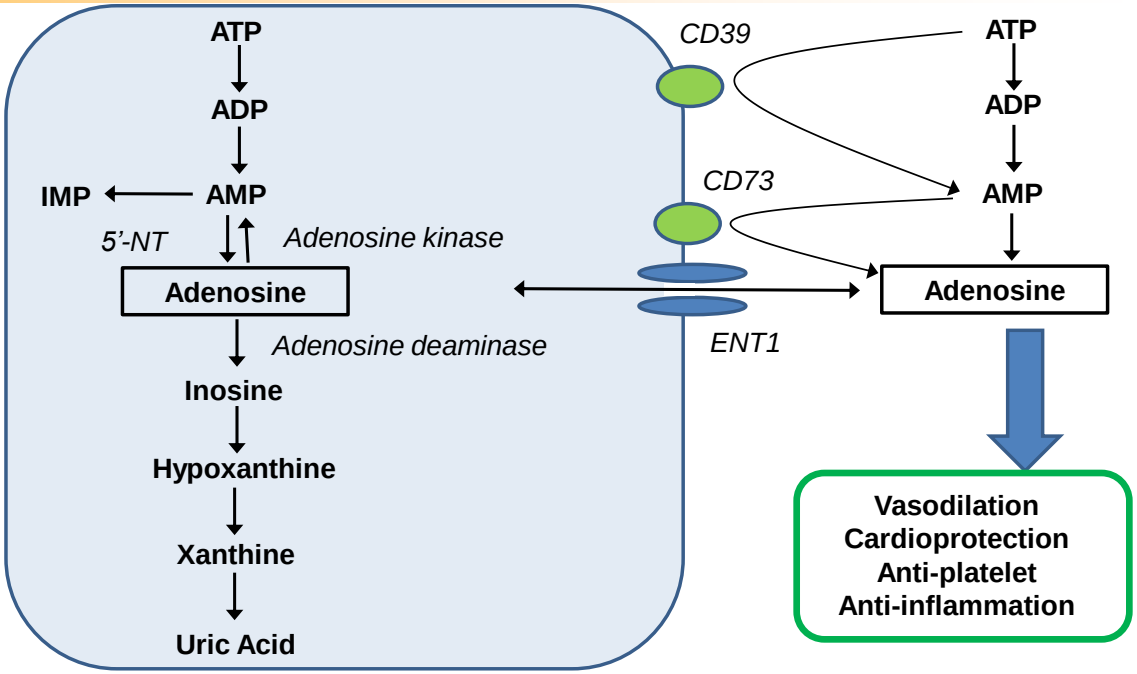
- **Episodios de leves a moderados y con duración menor a una semana.**

Wallentin L, et al. N Engl J Med. 2009;361:1045–1057

Ticagrelor: doble mecanismo de acción

Equilibrative Nucleoside Transporter Type 1 (ENT1): Ticagrelor Additional Mode of Action

- Hypoxia prohibits regeneration of ATP from Adenosine leading to a large increase in intracellular adenosine concentration
- Adenosine transporter maintains equal intra- and extra-cellular concentrations, i.e. starts pumping adenosine out of the cell
- So, hypoxia or tissue damage result in locally increased circulating adenosine levels



CONCLUSIONS

In patients who have an acute coronary syndrome with or without ST-segment elevation, treatment with ticagrelor as compared with clopidogrel significantly reduced the rate of death from vascular causes, myocardial infarction, or stroke without an increase in the rate of overall major bleeding but with an increase in the rate of non–procedure-related bleeding. (ClinicalTrials.gov number, NCT00391872.)

Guidelines: 'Pretratamiento'

ESC STEMI 2012

3.5.3.2 Periprocedural pharmacotherapy (Table 12)

Patients undergoing primary PCI should receive a combination of DAPT with aspirin and an adenosine diphosphate (ADP) receptor blocker, as early as possible before angiography, and a parenteral anticoagulant. No trials to date have evaluated the commencement of DAPT prior to hospital admission, rather than in hospital, nor its use before, rather than during, angiography in the setting of STEMI, but this is common practice in Europe and is consistent with the pharmacokinetic data for oral antithrombotic agents, suggesting that the earliest administration would be preferable to achieve early efficacy.

Steg G, et al. Eur Heart.J (2012) 33 (20): 2569 – 2619.

2014 ESC M.I. Revascularisation: ICPp

Recommendations	Class[a]	Level[b]	Ref[c]
Antiplatelet therapy			
ASA is recommended for all patients without contraindications at an initial oral loading dose of 150–300 mg (or 80–150 mg i.v.) and at a maintenance dose of 75–100 mg daily long-term regardless of treatment strategy.	I	A	776,794
A $P2Y_{12}$ inhibitor is recommended in addition to ASA and maintained over 12 months unless there are contraindications such as excessive risk of bleeding. Options are:	I	A	–
• Prasugrel (60 mg loading dose, 10 mg daily dose) if no contraindication	I	B	828
• Ticagrelor (180 mg loading dose, 90 mg twice daily) if no contraindication	I	B	823
• Clopidogrel (600 mg loading dose, 75 mg daily dose), only when prasugrel or ticagrelor are not available or are contraindicated.	I	B	812
It is recommended to give $P2Y_{12}$ inhibitors at the time of first medical contact.	I	B	777,846–848
GP IIb/IIIa inhibitors should be considered for bail-out or evidence of no-reflow or a thrombotic complication.	IIa	C	–
Upstream use of a GP IIb/IIIa inhibitor (vs. in-lab use) may be considered in high-risk patients undergoing transfer for primary PCI.	IIb	B	271,834, 835,849

Background:

- Los trabajos en los que se apoya esta recomendación IB de las guías de revascularización 2014 están realizados con Clopidogrel.

- En ellos se sugiere que podría haber un beneficio en el pretratamiento con Clopidogrel (STEMI e ICPp), en terminos de eventos isquémicos, y que además no llevaría aparejado un exceso de sangrados.

- Ticagrelor demostró una mayor eficacia que Clopidogrel durante el estudio PLATO en un amplio espectro de pacientes con SCA, y en concreto en el subgrupo de pacientes STEMI que van a ICPp.

- En el estudio ATLANTIC se evalua la eficacia y seguridad de la administración prehospitalaria de Ticagrelor vs a la administración hospitalaria.

*Almost all causes of death were related to cardiogenic shock, cardiac arrest, or cardiac rupture rather than bleeding or ischaemic events. Patient records have been specifically examined and no treatment related effect can be discerned

†Fisher's exact test

‡Probable stent thrombosis was defined as any death occurring in a stented patient within 30 days

Events occurring up to the date of last study visit (to a maximum of 32 days) are included in the table. Patients could be on study treatment or not when the event occurred

mITT analysis: Each event is counted once in each row. A single event may be counted in more than one row. Odds ratios for pre-hospital group versus in hospital group, two-sided 95% CIs and *P* values were calculated from a logistic regression model, with treatment as the only explanatory variable Difference in binomial proportions calculated for pre-hospital – in-hospital ticagrelor

Montalescot G et al. N Engl J Med September 1, 2014 [Epub ahead of print; DOI: 10.1056/NEJMoa1407024]

ATLANTIC: Conclusion

Pre-hospital ticagrelor administration a short time before PCI in patients with ongoing STEMI is **safe** but **does not improve pre-PCI coronary reperfusion**. It may, however, **reduce the risk of post-PCI stent thrombosis**.

Main study characteristics of novel P2Y12 antagonists vs clopidogrel in medically treated ACS

	PLATO substudy	TRILOGY-ACS
Design	Pre-specified substudy of PLATO	Ad hoc double blind randomised trial
N° of patients randomised	5,216	9,326
Type of ACS	STEMI/NSTE-ACS	NSTE-ACS
N° of patients with NSTE-ACS	4,751	9,326
Risk Factors		
Age (Median, IQ range)	65, 57-73	66, 58-74
Women (%)	36.5	39.2
% Hypertension	72.1	82.0
% Current smoking	25.5	20.0
% Diabetes	29.8	38.0
Prior MI	39.6	43.1
Tested		
Loading	Ticagrelor 180mg	Prasugrel 30mg (if<72h and not on clopidogrel)
Maintenance	Ticagrelor 90mg BID	Prasugrel 10mg daily (5mg if weight <60kg or age >75 years).
Comparator		
Loading	Clopidogrel 300 mg	Clopidogrel 300 mg
Maintenance	Clopidogrel 75mg daily	Clopidogrel 75mg daily
Aspirin background	75-100mg daily	<100 mg daily in 33.3%
Follow-up, months, median	9.2	14.8
Crossover to PCI (%)	40.0	7.9

Ticagrelor versus clopidogrel in patients with acute coronary syndromes intended for non-invasive management: substudy from prospective randomised PLATelet inhibition and patient Outcomes (PLATO) trial. BMJ 2011;342:d3527.

Prasugrel versus clopidogrel for acute coronary syndromes without revascularization. N Engl J Med 2012;367:1297-309

Main study outcomes of novel P2Y12 antagonists vs clopidogrel in medically treated ACS

	PLATO substudy	TRILOGY-ACS
Primary endpoint	CV death, MI and stroke (all patients randomised)	CV death, MI and stroke in patients <75 years
HR (95% CI)	0.85 (0.73 to 1.00)	0.91 (0.78-1.05)
p	0.045	0.21
CV death, MI and stroke (all patients randomised)		
HR (95% CI)	0.85 (0.73 to 1.00)	0.96 (0.86-1.07)
p	0.045	0.45
All cause death		
HR (95% CI)	0.75 (0.61 to 0.93)	0.94 (0.82-1.08)
p	0.010	0.40

TRITON (Prasugrel):

- Pacientes entraban en el estudio después de conocer la anatomía coronaria.
- Todos los pacientes fueron mayoritariamente a ICP. No se consideraron otras estrategias de tratamiento: manejo médico 1,1% o CABG 3,2%.
- No se permitió el pre-tratamiento con Clopidogrel.
- DC de Clopidogrel: 300mg

PLATO (Ticagrelor):

- Pacientes entraban en el estudio en las fases iniciales. No había necesidad de conocer la anatomía coronaria.
- No sólo ICP, sino también otras estrategias de tratamiento: manejo médico 34% y CABG 10,2%.
- Podían ser pre-tratados con clopidogrel en abierto (46%). En el brazo de Ticagrelor fue cambiado a Ticagrelor en el momento de la randomización.
- DC de Clopidogrel: 300 ó 600 mg (según criterio clínico)

Wallentin L, et al. N Engl J Med 2009;361:1045–1057; Wiviott, S et al. N Engl J Med 2007;357:2001-15

2014 AHA/ACC NSTE-ASC GUIDELINE

4.3. Initial Antiplatelet/Anticoagulant Therapy in Patients With Definite or Likely NSTE-ACS

4.3.1. Initial Oral and Intravenous Antiplatelet Therapy in Patients With Definite or Likely NSTE-ACS Treated With an Initial Invasive or Ischemia-Guided Strategy: Recommendations

See Table 7 for a summary of recommendations from this section and Online Data Supplement 15 for additional information on initial oral and intravenous antiplatelet therapy in patients with definite or likely NSTE-ACS treated with an early invasive or an ischemia-guided strategy.

Class I[‡]

1. **Non–enteric-coated, chewable aspirin (162 mg to 325 mg) should be given to *all* patients with NSTE-ACS without contraindications as soon as possible after presentation, and a maintenance dose of aspirin (81 mg/d to 162 mg/d) should be continued indefinitely (288-290). *(Level of Evidence: A)***
2. **In patients with NSTE-ACS who are unable to take aspirin because of hypersensitivity or major gastrointestinal intolerance, a loading dose of clopidogrel followed by a daily maintenance dose should be administered (291). *(Level of Evidence: B)***
3. **A $P2Y_{12}$ inhibitor (either clopidogrel or ticagrelor) in addition to aspirin should be administered for up to 12 months to all patients with NSTE-ACS without contraindications who are treated with either an early invasive[§] or ischemia-guided strategy. Options include:**
   - **Clopidogrel: 300-mg or 600-mg loading dose, then 75 mg daily (289, 292) *(Level of Evidence: B)***
   - **Ticagrelor[‖]: 180-mg loading dose, then 90 mg twice daily (293, 294) *(Level of Evidence: B)***

2014 AHA/ACC NSTE-ASC GUIDELINE

4.3. Initial Antiplatelet/Anticoagulant Therapy in Patients With Definite or Likely NSTE-ACS

4.3.1. Initial Oral and Intravenous Antiplatelet Therapy in Patients With Definite or Likely NSTE-ACS Treated With an Initial Invasive or Ischemia-Guided Strategy: Recommendations

See Table 7 for a summary of recommendations from this section and Online Data Supplement 15 for additional information on initial oral and intravenous antiplatelet therapy in patients with definite or likely NSTE-ACS treated with an early invasive or an ischemia-guided strategy (http://jaccjacc.cardiosource.com/acc_documents/2014_NSTE-ACS_Data_Supplement_Tables.pdf).

Class IIa

1. **It is reasonable to use ticagrelor in preference to clopidogrel for $P2Y_{12}$ treatment in patients with NSTE-ACS who undergo an early invasive or ischemia-guided strategy (293, 294). *(Level of Evidence: B)***

Class IIb

1. **In patients with NSTE-ACS treated with an early invasive strategy and dual antiplatelet therapy (DAPT) with intermediate/high-risk features (e.g., positive troponin), a GP IIb/IIIa inhibitor may be considered as part of initial antiplatelet therapy. Preferred options are eptifibatide or tirofiban (43, 94, 295). (*Level of Evidence: B*)**

2014 AHA/ACC NSTE-ASC GUIDELINE

5.1.2. PCI—Antiplatelet and Anticoagulant Therapy

5.1.2.1. Oral and Intravenous Antiplatelet Agents: Recommendations

Class I

1. **Patients already taking daily aspirin before PCI should take 81 mg to 325 mg non–enteric-coated aspirin before PCI (26, 368-370). *(Level of Evidence: B)***
2. **Patients not on aspirin therapy should be given non–enteric-coated aspirin 325 mg as soon as possible before PCI (26, 368-370). *(Level of Evidence: B)***
3. **After PCI, aspirin should be continued indefinitely at a dose of 81 mg to 325 mg daily (27, 288, 371). *(Level of Evidence: B)***
4. **A loading dose of a $P2Y_{12}$ receptor inhibitor should be given before the procedure in patients undergoing PCI with stenting (26, 293, 302, 331, 372-375). *(Level of Evidence: A)* Options include:**
    a. **Clopidogrel: 600 mg (331, 372-374, 376-378) *(Level of Evidence: B)* or**
    b. **Prasugrel[#]: 60 mg (302) *(Level of Evidence: B)* or**
    c. **Ticagrelor[‖]: 180 mg (293) *(Level of Evidence: B)***
5. **In patients with NSTE-ACS and high-risk features (e.g., elevated troponin) not adequately pretreated with clopidogrel or ticagrelor, it is useful to administer a GP IIb/IIIa inhibitor (abciximab, double-bolus eptifibatide, or high-dose bolus tirofiban) at the time of PCI (379-382). *(Level of Evidence: A)***
6. **In patients receiving a stent (bare-metal stent or drug-eluting stent [DES]) during PCI for NSTE-ACS, $P2Y_{12}$ inhibitor therapy should be given for at least 12 months (330). Options include:**
    a. **Clopidogrel: 75 mg daily (296, 331) *(Level of Evidence: B)* or**
    b. **Prasugrel[#]: 10 mg daily (302) *(Level of Evidence: B)* or**
    c. **Ticagrelor[‖]: 90 mg twice daily (293) *(Level of Evidence: B)***

2014 AHA/ACC NSTE-ASC GUIDELINE

5.1.2. PCI—Antiplatelet and Anticoagulant Therapy

5.1.2.1. Oral and Intravenous Antiplatelet Agents: Recommendations

Class IIa

1. **It is reasonable to choose ticagrelor over clopidogrel for $P2Y_{12}$ inhibition treatment in patients with NSTE-ACS treated with an early invasive strategy and/or coronary stenting (293, 294). *(Level of Evidence: B)***
2. **It is reasonable to choose prasugrel over clopidogrel for $P2Y_{12}$ treatment in patients with NSTE-ACS who undergo PCI who are not at high risk of bleeding complications (302, 303). *(Level of Evidence: B)***
3. **In patients with NSTE-ACS and high-risk features (e.g., elevated troponin) treated with UFH and adequately pretreated with clopidogrel, it is reasonable to administer a GP IIb/IIIa inhibitor (abciximab, double-bolus eptifibatide, or high-bolus dose tirofiban) at the time of PCI (195, 383, 384). (*Level of Evidence: B*)**
4. **After PCI, it is reasonable to use 81 mg per day of aspirin in preference to higher maintenance doses (331, 368, 385-388). *(Level of Evidence: B)***

[#]Patients should receive a loading dose of prasugrel, provided that they were not pretreated with another $P2Y_{12}$ receptor inhibitor.
[‖]The recommended maintenance dose of aspirin to be used with ticagrelor is 81 mg daily (290).

2014 AHA/ACC NSTE-ASC GUIDELINE

PCI With Stenting

Initiate/continue antiplatelet and anticoagulant therapy

1. ASA (Class I; LOE: B)

2. $P2Y_{12}$ Inhibitor (in addition to ASA):
   - Clopidogrel (Class I; LOE: B) or
   - Prasugrel (Class I; LOE: B) or
   - Ticagrelor (Class I; LOE: B)

3. GPI (if not treated with bivalirudin at time of PCI)
   - High-risk features, not adequately pretreated with clopidogrel (Class I; LOE: A)
   - High-risk features adequately pretreated with clopidogrel (Class IIa; LOE: B)

4. Anticoagulant:
   - Enoxaparin (Class I; LOE: A) or
   - Bivalirudin (Class I; LOE: B) or
   - Fondaparinux† as the sole anticoagulant (Class III: Harm; LOE: B) or
   - UFH (Class I; LOE: B)

CABG

Initiate/continue ASA therapy and discontinue $P2Y_{12}$ and/or GPI therapy

1. ASA (Class I; LOE: B)

2. Discontinue clopidogrel/ticagrelor 5 d before, and prasugrel at least 7 d before elective CABG

3. Discontinue clopidogrel/ticagrelor up to 24 h before urgent CABG (Class I; LOE: B). May perform urgent CABG <5 d after clopidogrel/ticagrelor and <7 d after prasugrel discontinued

4. Discontinue eptifibatide/tirofiban at least 2-4 h before, and abciximab ≥12 h before CABG (Class I; LOE: B)

ESC GUIDELINES

ESC Guidelines for the management of acute coronary syndromes in patients presenting without persistent ST-segment elevation

The Task Force for the management of acute coronary syndromes (ACS) in patients presenting without persistent ST-segment elevation of the European Society of Cardiology (ESC)

Hamm CW, et al. Eur Heart.J (2011) 32: 2999-3054

ESC SCASEST 2011: Estratificación del riesgo

Recomendaciones para el diagnóstico y la estratificación del riesgo

Recomendaciones	Clase[a]	Nivel[b]	Ref[c]
En pacientes con sospecha de SCASEST, el diagnóstico y la estratificación del riesgo isquémico/hemorrágico a corto plazo se debe basar en la combinación de la historia clínica, síntomas, hallazgos físicos, ECG (monitorización del segmento ST continua o repetida) y biomarcadores	I	A	16, 18, 27, 30, 56-58
Se recomienda el uso de clasificaciones de riesgo establecidas para el pronóstico y el sangrado (p. ej., GRACE, CRUSADE)	I	B	50, 83
y antes del alta hospitalaria			
Se recomiendan otras derivaciones para el ECG (V_{3R}, V_{4R}, V_7-V_9) cuando las derivaciones habituales no son concluyentes	I	C	18
Se debe tomar una muestra de sangre rápidamente para la determinación de troponinas (troponina cardiaca T o I). Los resultados deben estar disponibles en un plazo de 60 min. La prueba debe repetirse a las 6-9 h de la evaluación inicial si la primera determinación no es concluyente. Es aconsejable repetir la determinación después de 12-24 h si el estado clínico sigue indicando SCA	I	A	27, 30
Se recomienda un protocolo rápido de exclusión (0 y 3 h) cuando se disponga de pruebas de alta sensibilidad para determinación de troponinas	I	B	20, 21, 23
Se recomienda un ecocardiograma a todos los pacientes para evaluar la función ventricular izquierda general y regional y para descartar o confirmar un diagnóstico diferencial	I	C	–
La angiografía coronaria está indicada en pacientes en los que se tenga que determinar la extensión de la enfermedad coronaria o de la lesión causal (véase la sección 5.4)	I	C	–
La angiografía coronaria por TC se debe considerar como una alternativa a la angiografía invasiva para excluir un SCA cuando hay una probabilidad baja a intermedia de enfermedad coronaria y cuando las troponinas y el ECG no sean concluyentes	IIa	B	37-41
En pacientes sin dolor recurrente, con ECG normal, troponinas negativas y clasificación de riesgo baja, se recomienda una prueba de estrés no invasiva para inducción de isquemia antes de decidir sobre la estrategia invasiva	I	A	35, 54, 55

CRUSADE: Can Rapid risk stratification of Unstable angina patients Suppress ADverse outcomes with Early implementation of the ACC/AHA guidelines; ECG: electrocardiograma; GRACE: Global Registry of Acute Coronary Events; SCA: síndrome coronario agudo; SCASEST: síndrome coronario agudo sin elevación del segmento ST; TC: tomografía computarizada.

Hamm CW, et al. Rev Esp Cardiol 2012;65(2):173.e1-e55

ESC SCASEST 2011: Momento de la Revascularización

Recomendaciones para la evaluación invasiva y la revascularización

Recomendaciones	Clase[a]	Nivel[b]	Ref.[c]
Está indicada una estrategia invasiva (en las primeras 72 h tras la presentación) para pacientes con: • Al menos un criterio de alto riesgo (tabla 9) • Síntomas recurrentes	I	A	148
Está indicada la angiografía coronaria urgente (< 2 h) para pacientes con riesgo isquémico muy alto (angina refractaria, insuficiencia cardiaca	I	C	148, 209
Está recomendada una estrategia invasiva precoz (< 24 h) para pacientes con una clasificación de riesgo GRACE > 140 o al menos un criterio principal de alto riesgo	**I**	**A**	**212, 215**
de la enfermedad, es decir, distribución y características angiográficas de la lesión (p. ej., clasificación SYNTAX), de acuerdo con el protocolo local del «Equipo del Corazón»			
Como no hay problemas de seguridad relacionados con el uso de *stents* farmacoactivos en los SCA, la indicación de estos se debe basar en las características basales individuales, la anatomía coronaria y el riesgo de hemorragia	I	A	225, 226
No está recomendada la ICP de lesiones no significativas	III	C	–
No está recomendada la evaluación invasiva por sistema de los pacientes de bajo riesgo	III	A	148, 208

CABG: cirugía de revascularización aortocoronaria; GRACE: Global Registry of Acute Coronary Events; ICP: intervención coronaria percutánea; SCA: síndrome coronario agudo; SYNTAX: SYNergy between percutaneous coronary intervention with TAXus and cardiac surgery.

2011 ESC NSTE-ACS Guidelines

Antiplatelets Therapy Recommendations

Recommendations	Class [a]	Level [b]
Aspirin should be given to all patients without contraindications at an initial loading dose of 150–300 mg, and at a maintenance dose of 75–100 mg daily long-term regardless of treatment strategy.	I	A
A $P2Y_{12}$ inhibitor should be added to aspirin as soon as possible and maintained over 12 months, unless there are contraindications such as excessive risk of bleeding.	I	A
Ticagrelor (180-mg loading dose, 90 mg twice daily) is recommended for all patients at moderate-to-high risk of ischaemic events (e.g. elevated troponins) , regardless of initial treatment strategy and including those pre-treated with clopidogrel (which should be discontinued when ticagrelor is commenced).	I	B
Prasugrel (60-mg loading dose, 10-mg daily dose) is recommended for $P2Y_{12}$-inhibitor-naïve patients (especially diabetics) in whom coronary anatomy is known and who are proceeding to PCI unless there is a high risk of life-threatening bleeding or other contraindications.[d]	I	B
Clopidogrel (300-mg loading dose, 75-mg daily dose) is recommended for patients who cannot receive ticagrelor or prasugrel.	I	A
A 600-mg loading dose of clopidogrel (or a supplementary 300-mg dose at PCI following an initial 300-mg loading dose) is recommended for patients scheduled for an invasive strategy when ticagrelor or prasugrel is not an option.	I	B
A higher maintenance dose of clopidogrel 150 mg daily should be considered for the first 7 days in patients managed with PCI and without increased risk of bleeding.	IIa	B

Hamm CW, et al. Eur Heart.J (2011) 32: 2999-3054

2011 ESC NSTE-ACS Guidelines

Management strategy (treatments).

Table 13 Checklist of treatments when an ACS diagnosis appears likely

Aspirin	Initial dose of 150–300 mg non-enteric formulation followed by 75–100 mg/day (i.v. administration is acceptable)
$P2Y_{12}$ inhibitor	Loading dose of ticagrelor or clopidogrel[a]
Anticoagulation	Choice between different options depends on strategy: • Fondaparinux 2.5 mg/daily subcutaneously • Enoxaparin 1 mg/kg twice daily subcutaneously • UFH i.v. bolus 60–70 IU/kg (maximum 5000 IU) followed by infusion of 12–15 IU/kg/h (maximum 1000 IU/h) titrated to aPTT 1.5–2.5 × control • Bivalirudin is indicated only in patients with a planned invasive strategy
Oral ß-Blocker	If tachycardic or hypertensive without signs of heart failure

aPTT = activated partial thromboplastin time; IU = international units; i.v. = intravenous; UFH = unfractionated heparin.

[a]Prasugrel is not mentioned as it is not approved as medical therapy before invasive strategy, but only after angiography when anatomy is known.

Table 14 Checklist of antithrombotic treatments prior to PCI

Aspirin	Confirm loading dose prior to PCI.
$P2Y_{12}$ inhibitor	Confirm loading dose of ticagrelor or clopidogrel prior to PCI. If $P2Y_{12}$ naïve, consider prasugrel (if <75 years age, >60 kg, no prior stroke or TIA)
Anticoagulation	• Fondaparinux pre-treated: add UFH for PCI • Enoxaparin pre-treated: add if indicated • UFH pre-treated: titrate to ACT >250 s, or switch to bivalirudin (0.1 mg/kg bolus followed by 0.25 mg/kg/h)
GP IIb/IIIa receptor inhibitor	• Consider tirofiban or eptifibatide in patients with high-risk anatomy or troponin elevation • Abciximab only prior to PCI in high-risk patients.

ACT = activated clotting time; GP, glycoprotein; PCI = percutaneous coronary intervention; TIA = transient ischaemic attack; UFH = unfractionated heparin.

Hamm CW, et al. Eur Heart.J (2011) 32: 2999-3054

2011 ESC NSTE-ACS Guidelines

Antiplatelets Therapy for CABG

A higher maintenance dose of clopidogrel 150 mg daily should be considered for the first 7 days in patients managed with PCI and without increased risk of bleeding.	IIa	B
Increasing the maintenance dose of clopidogrel based on platelet function testing is not advised as routine, but may be considered in selected cases.	IIb	B
Genotyping and/or platelet function testing may be considered in selected cases when clopidogrel is used.	IIb	B
In patients pre-treated with $P2Y_{12}$ inhibitors who need to undergo non-emergent major surgery (including CABG), postponing surgery at least for 5 days after cessation of ticagrelor or clopidogrel, and 7 days for prasugrel, if clinically feasible and unless the patient is at high risk of ischaemic events should be considered.	IIa	C
Ticagrelor or clopidogrel should be considered to be (re-) started after CABG surgery as soon as considered safe.	IIa	B
The combination of aspirin with an NSAID (selective COX-2 inhibitors and non-selective NSAID) is not recommended.	III	C

[a]Class of recommendation.
[b]Level of evidence.
[c]References.
[d]Prasugrel is in the 'Guidelines on Revascularization'[148] given a IIa recommendation as the overall indication including clopidogrel-pre-treated patients and/or unknown coronary anatomy. The class I recommendation here refers to the specifically defined subgroup.
CABG = coronary artery bypass graft; COX = cyclo-oxygenase; DAPT = dual (oral) antiplatelet therapy; NSAID = non-steroidal anti-inflammatory drug; PCI = percutaneous coronary intervention.

Según FT Ticagrelor debe suspenderse 7 días antes de una intervención quirúrgica programada.

Hamm CW, et al. Eur Heart.J (2011) 32: 2999-3054

European Heart Journal
doi:10.1093/eurheartj/ehs149

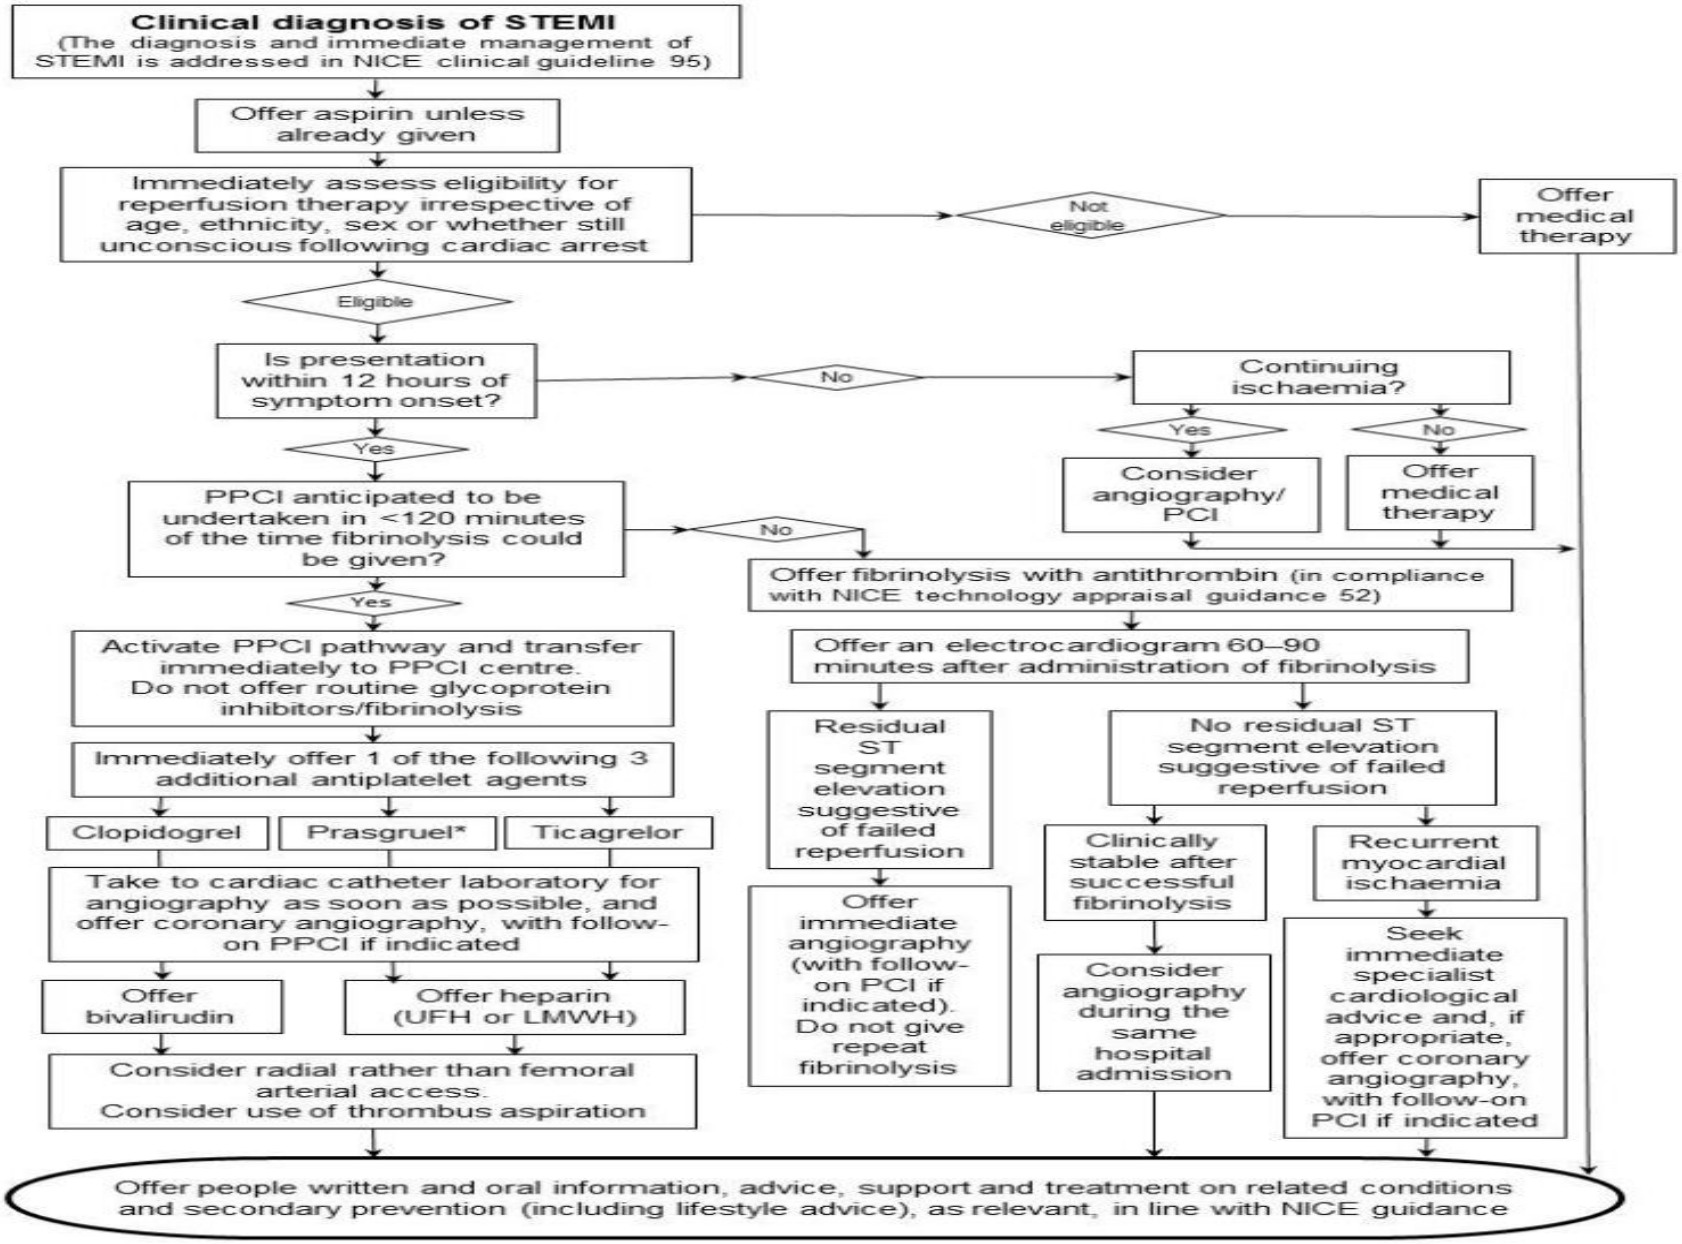
Cost-effectiveness of treating acute coronary syndrome patients with ticagrelor for 12 months: results from the PLATO study

Conclusion Based on clinical and health-economic evidence from the PLATO study, treating ACS patients with ticagrelor for 12 months is associated with a cost per QALY below generally accepted thresholds for cost-effectiveness.
ClinicalTrials.gov Identifier: NCT00391872.

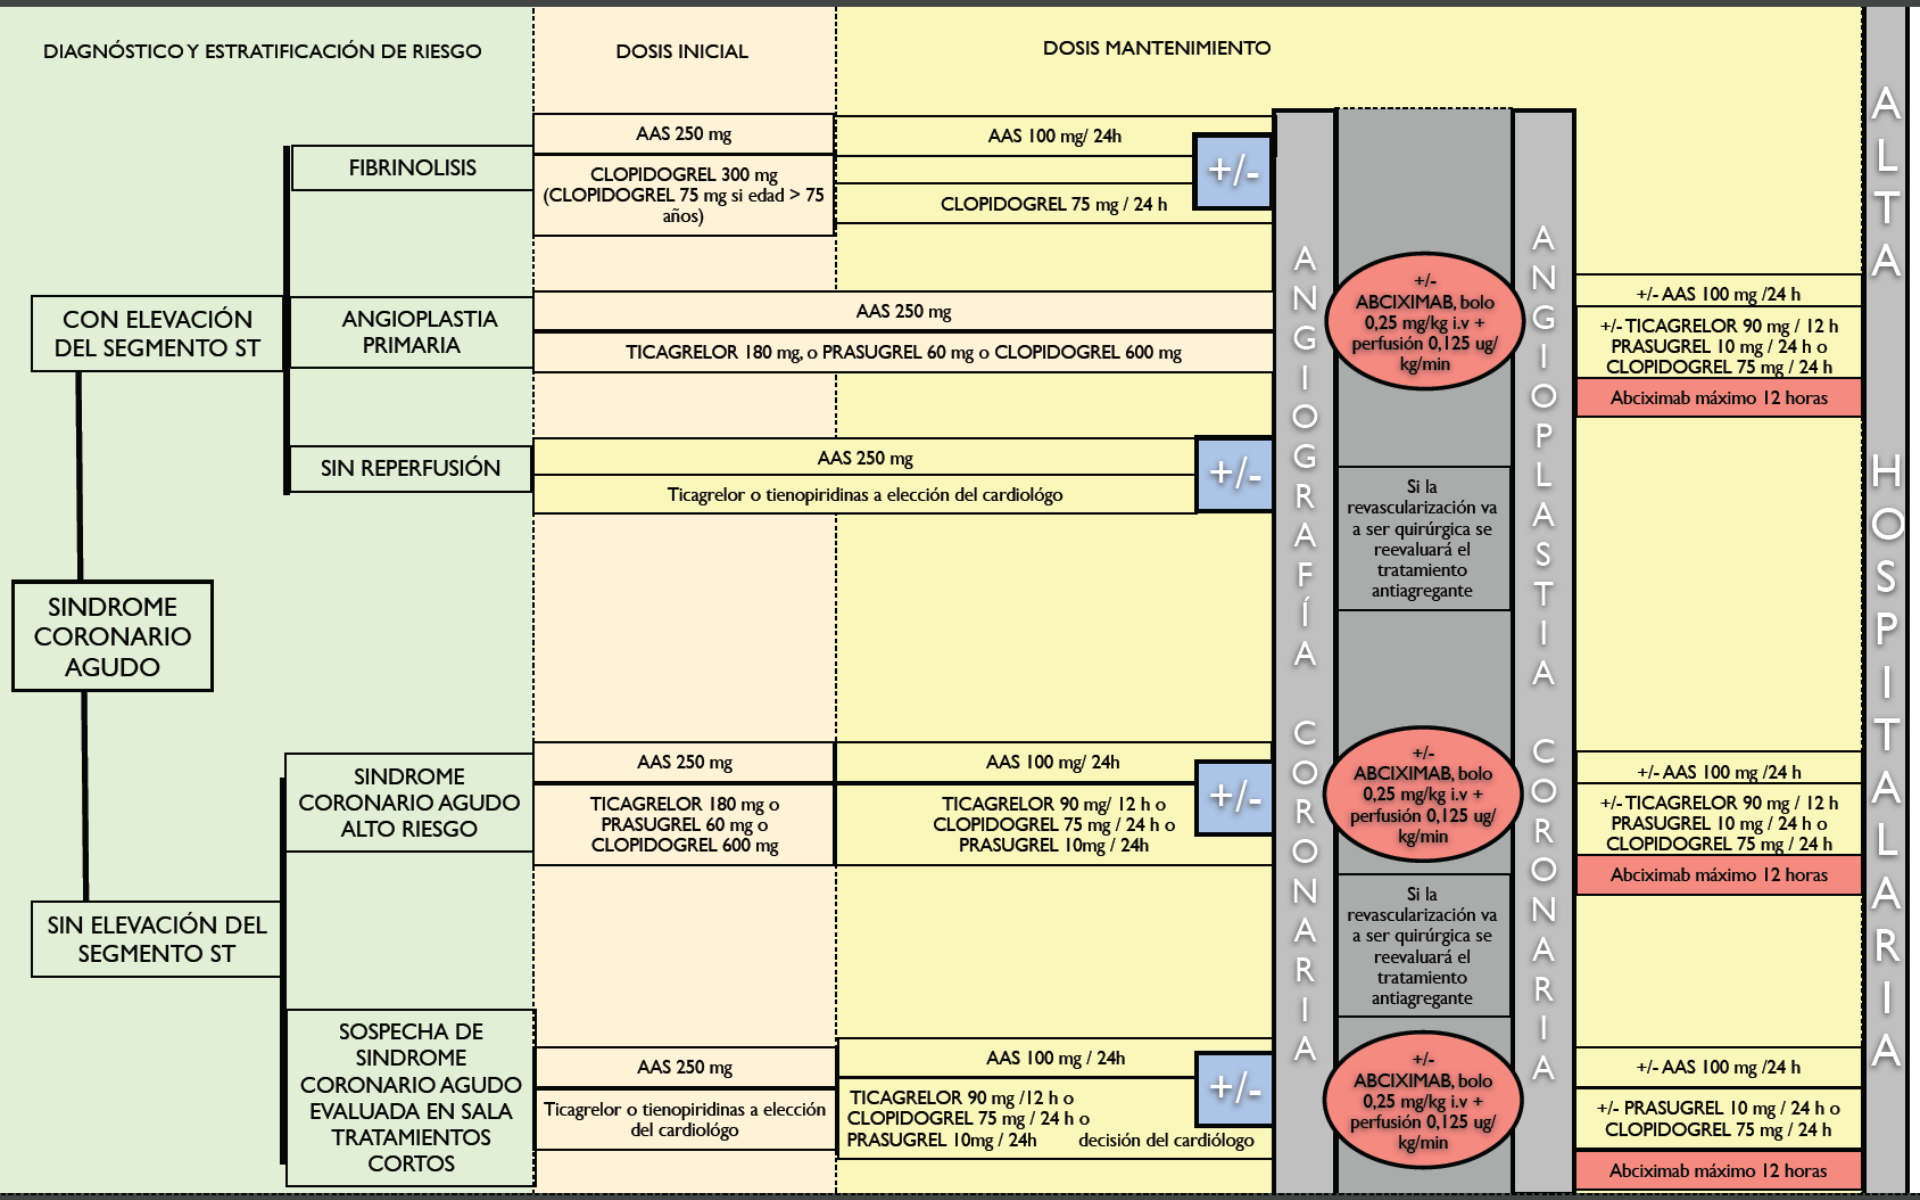
NICE National Institute for Health and Care Excellence

The Committee noted that the incremental cost-effectiveness ratios (ICERs) produced with this analysis were within the range normally considered to be a cost-effective use of NHS resources.	4.12

NICE National Institute for Health and Care Excellence



PROTOCOLO ANTIAGREGACIÓN EN SINDROME CORONARIO AGUDO



TICAGRELOR	Implica tomar dos dosis diarias... valorar cumplimiento terapéutico No usar si disfunción sinusal o bloqueo av	
PRASUGREL	Razones a favor de su uso: - Diabetes - Anatomía coronaria conocida, se cree no quirúrgico a priori - Evento agudo pese a clopidogrel	Razones en contra de su uso: - antecedentes de AIT o ICTUS. - peso < 60 kg y edad > 75 años - > riesgo de sangrado.

- TICAGRELOR/PRASUGREL no han sido evaluados en combinación con anti IIb/IIIa o fibrinolíticos

- SCA en tratamiento previo con clopidogrel: se puede hacer el switch, simplemente suspendiendo clopidogrel e iniciando carga y dosis de mantenimiento habitual de ticagrelor o prasugrel.
- Si ya se ha dado carga de alguno de ellos lo razonable es continuar con el mismo (no mezclar cargas de distintos fármacos)
